

Synthesis Layer Overview

The synthesis layer is LYKN's portable memory graph. It accumulates what you save, what you believe, and what you're working on — then makes that context available to every AI client you connect.

What it is

Unlike chat history locked inside one app, the synthesis layer is yours. It lives in LYKN and travels with you through MCP-connected tools — ChatGPT, Claude, Cursor, Gemini, and the in-app chat all read from the same source of truth.

Neuron categories

- Chats — conversation history and the reasoning behind each thread.
- Vault — files, links, notes, and the meanings LYKN extracts from them.
- Beliefs — principles you've ratified that models should respect and apply.
- Facts — concrete truths you've confirmed about yourself and your work.
- Concepts — thematic clusters that keep related ideas coherent over time.
- Projects — active goals, deadlines, and open threads in one workspace.

How items become neurons

When you save something to the Vault, LYKN reads it, extracts signals, and connects new neurons to ones already in your graph. A PDF about pricing connects to billing facts. A meeting note connects to the project it belongs to. Over time, the graph reflects how you actually think — not a flat folder tree.

Why it matters

Every connected model stops guessing. Instead of re-explaining your preferences, your stack, or your current project in every new chat, the synthesis layer supplies that context up front — and keeps learning as you work.

Synthesis Layer Overview

Read path (every session)

Connected AI clients call `lykn_getContextBlock` at the start of a conversation. The response bundles your active beliefs, governance rules, identity facts, and current project state into one block the model treats as binding context.

Write path (as you work)

- `lykn_proposeBelief` — when a durable principle emerges that you haven't ratified yet.
- `lykn_recordRuleApplication` — audit trail when a model follows one of your rules.
- `lykn_pushProjectState` — when a conversation produces a decision about an active project.

Caps and plans

Free accounts include a starter neuron cap. Pro unlocks unlimited vault storage and unlimited synthesis neurons — the graph can grow without artificial limits as your knowledge base scales.

In the product

Open the Synthesis page to explore your graph in 3D. Category clusters show density at a glance; click any neuron to see why it exists and what it connects to. The wake tour and vault preview demonstrate how capture feeds the graph in real time.
